Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

DETAILED ACTION

Election/Restrictions

Applicant's election of claims 1-5 and 10-11 in the reply filed on 6-23-04 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-5 and 10-11 are rejected under 35 U.S.C. 102(b) as being anticipated by Takashi (JP 10-41492). Takashi discloses a solid-state image device, comprising a package including at least one corner that has a recessed portion (Fig.3 el.9a), wherein the recessed portion is defined by an end face including at least two linear portions observed when being seen from an upper surface side of the package (Fig.3) **[claim 1]**. Takashi also discloses a solid-state image device, comprising a package having at least two recessed portions (el.9a) formed at least at one selected from two adjacent side ends of the package, wherein the at least two recessed portions are defined by an end face including linear portions observed when being seen from an upper surface side of

the package (Fig.3) **[claim 2]**; wherein the linear portions are substantially parallel to either of two adjacent side ends, respectively (Fig.3 el.9) **[claim 3]**; wherein the package comprises: a member for patterning (el.9), on a surface of which a conductor pattern (el.11) for transmitting signals from a solid-state image element (el.2) is formed; and a frame member (el.13) that has an opening surrounding the solid-state image element and is positioned above the member for patterning, and the at least two linear portions, in the recessed portion, observed when the recessed portion is seen from the upper surface side of the package, being formed of the member for patterning (Fig.3) **[claim 4]**; wherein the package comprises: a member for patterning (el.9), on a surface of which a conductor pattern (el.11) for transmitting signals from a solid-state image element (el.2) is formed; and a frame member (el.13) that has an opening surrounding the solid-state image element and is positioned above the member for patterning, and the linear portions, in the at least two recessed portions, observed when the at least two recessed portions are seen from the upper surface side of the package, being formed of the member for patterning (Fig.3) **[claim 5]**. Takashi also discloses a camera comprising: a solid-state image device according to claim 1; and a lens block (el.16) having at least two projections (el.17) coming into contact with the at least two linear portions respectively, which are observed when the solid-state image device is seen from the upper surface side, in the recessed portion along their shapes and a lens (el.14) focusing external light onto a solid-state image element (el.2) included in the solid-state image device, wherein the solid-state image device and the lens block are positioned with the at least two projections being in contact with the at least two linear

portions along their shapes, respectively (Fig.3) **[claim 10]**; and a camera comprising: a solid-state image device according to claim 2; and a lens block (el.16) having at least two projections (el.17) coming into contact with the linear portions respectively, which are observed when the solid-state image device is seen from the upper surface side, in the at least two recessed portion along their shapes and a lens (el.14) focusing external light onto a solid-state image element (el.2) included in the solid-state image device, wherein the solid-state image device and the lens block are positioned with the at least two projections being in contact with the linear portions along their shapes, respectively (Fig.3) **[claim 11]**.
